

MARINE AND FOOD PROCESSING TECH

Having a unique geological position, in the middle of the Mid-Atlantic Ridge, Iceland possesses special conditions needed to generate geothermal energy. The country has a high degree of volcanism and Icelandic specialists have through the years built up expertise in utilizing geothermal energy in a responsible way. This has enabled Iceland to become the world leader in the production of this eco-friendly, sustainable and renewable power.

RESPONSIBLE USE OF NATURAL RESOURCES

Energy production in harmony with nature and society is one of the main challenges of this century and the demand for expertise in the field is growing. Responsible use of fish stocks and other natural resources is an important part of Iceland's environmental policies. This enables Icelandic industries to supply clean products and at the same time opens new possibilities in technology where purity and sustainability is all-important.

GREEN TECHNOLOGY FOR MARINE AND FOOD PROCESSING

Icelandic food production concentrate on quality and fresh materials. Pure Icelandic nature provides healthy foods to local and global markets. Through the centuries fisheries have been the lifeline of the nation, both as its main food supply,

and its chief export product. Sustainability and secure production is most important and Iceland has become a leading country in the advancement of marine and food processing technology.

PROMOTING SUSTAINABILITY AND IMPROVING EFFICIENCY

Icelandic companies are focused on increasing yield and reducing waste, to promote sustainability in aquaculture, fisheries and food processing. Businesses are constantly working to find ways to improve efficiency in the industry. Customers are, for example, looking for solutions that use less water and electricity, and that also offer impeccable hygiene and traceability.

"Fishing is intertwined with nation's history and culture and one could say that seamanship is part of the identity of every Icelander."

– Responsible Fisheries Video
